Model-driven engineering Model-driven engineering (MDE) is the discipline of applying and effectively using a model-based development (MBD) strategy and methodology to improve software development process efficiency and effectiveness. MDE uses models to provide an abstraction of the real world that enables developers to use test cases, analysis techniques, and reasoning about

---

requirements to find issues and solve problems. In a model-driven engineering (MDE) environment, models are a central part of the software development process, and MDE techniques are used at multiple phases of the process. In such a world, the concept of models are a common one and the language of the models is naturally MDE. Many aspects of the process can be enabled or reduced through MDE, such as analysis, 6a5afdab4c

IT Monitor is a powerful and reliable network service that proactively monitors every aspect of your LAN and WAN network. It is not a replacement for unix utilities, but rather monitors your entire network infrastructure and alerts you to any problems. IT Monitor runs as a Windows service and can be configured to run in daemon mode without requiring user intervention. In this mode it continuously monitors network traffic, and alerts you to potential problems. Multiple remote sites can be monitored using a central server on a LAN. You can configure IT Monitor to alert you to any

---

problems in your networks. IT Monitor includes built-in configuration options and a number of pre-defined monitoring functions. With these you can configure the product to:

- ☐ Detect and correct problems before network users start complaining
- ☐ Alert you when problems exist
- ☐ Control what devices are included on the network
- ☐ Alert you to potential problems before they occur
- ☐ Alert you of changes in network usage without having to wait until an event occurs
- ☐ Alert you when a domain name expires
- ☐ Alert you when a web site update occurs
- ☐ Alert you when your network settings change, such as sending mail to a different mail server.

IT Monitor is also fully compatible with BIND and SEND,

---

as well as CNAME records. Once you have confirmed a problem has occurred, you are alerted by e-mail, text message (SMS), and can also manually trigger the relevant action from the Product Manager (purchased separately) or Web Manager (not included with IT Monitor). But what makes IT Monitor special is that it proactively manages all your network devices without you having to manage them. IT Monitor can be configured with a number of user-defined monitoring rules which can be enabled to alert you to any and all problems. When it detects a problem, IT Monitor notifies you via e-mail, text message, and can automatically perform the relevant action. IT Monitor can be configured to check all available

---

endpoints (servers, network devices, etc.) and send alerts for these. It also checks content of incoming and outgoing network traffic, including FTP sites. It monitors databases, as well as Internet based services such as FTP sites and Novell Netware/NDS Server. The application can be configured to run in Server (daemon mode) to continuously monitor your network, detecting potential problems and proactively managing your network. It can also be configured to notify you of changes to DNS
