This invention relates to fluid dispensing, and more particularly to a replaceable tip assembly for jetters for use in human joint aspiration. Jetters are used in human joint aspiration for aspiration of synovial fluid for the purpose of diagnosing rheumatoid arthritis. They comprise a dispenser body, usually made of polyethylene, and a replaceable tip attached thereto, usually made of polyethylene. In one form, the tip is a tubular member, open at both ends, with a pair of pistons held in a displaceable position by O-rings, between the walls of the open ends, so that a portion of the open end is in contact with the outer side of the tube. The plastic tip is cut to length, and is then slipped over the end of the tube, with the ends of the tip held by a pair of O-rings on the outer surface of the tube. An external threaded portion of the tube is extended through the center of the tip and then tightened against the O-rings. The resulting assembly is then slipped into the dispenser body to form the replaceable tip. This type of tip is suitable for use with a relatively small diameter tube, having a diameter up to about three-eighths inch. It is not readily adaptable to larger diameter tubes because the O-rings, being of soft plastic material, do not provide the required tightness for a strong seal. Moreover, the dimensions of the threads must be sufficiently small to permit the assembly to be slipped into the dispenser body, and yet sufficiently large to resist leakage. Therefore, such a tip cannot be used with tubes of more than about three-sixteenths inch diameter. It is necessary, therefore, to use different tips with tubes of various diameters. This means that, with a given jetter system, a hospital or physician must keep a substantial inventory of supplies on hand, since he can only use a single tip for a single size tube. In addition, the use of different tips in connection with different size tubes not only requires inventory and record keeping with the products, but also results in increased time in identification of the correct tip for use with a given tube. This of course makes it difficult to keep accurate records. Another problem with this design of tip is that, because it is cut to length, it cannot be made of different materials, and hence is not truly replaceable. For example, if a portion of the polyethylene tip breaks off, it is not possible to

This is a very resourceful camera, but it does have some disadvantages. It can't run pretty much all of my current lenses. The EF-S 10-22 has a 14-16mm internal zoom, the APS-C lenses 15-22mm with 1.8x. I have a couple of prime lenses, and a 50mm 1.8, but because it's so heavy (6.3 pounds), I can't really shoot in low light with any lens but the 50mm. It also is a fairly simple camera with no CPU or anything like that. It has the capability of wireless and up to 400 photos. It's also fairly quiet for such a large camera. It's easy to mount and there are various adapters for other body mounts (see specs list below). It's got two continuous AF points, the 50mm 1.8 does not have it. It has a shutter-lock feature and has two control dials. The very first minolp cameras, the YS-1, YS-2, and YS-3, had a lot of disadvantages. They had a very small AF area, built in 4x magnifications, very bad focusing in low light, they did not have dual control dials, touch screens for play and record, and they didn't have a vari-angle control or an optical view finder. Sony's X10 was essentially, with added features, the YS-50, which had many advantages over the YS-50. Sony's X10 which replaced the X10 was basically the X10 with added features. It was larger and heavier, offered more features and offered over 2x the photos (and approximately 3x the memory) and an improved continuous AF performance. But a huge plus for the X10 over the YS-50 is that its still under \$600 (and gets cheaper) and it has an optical view finder (which the YS-50 can't afford). The X10 had a better 3-way control dial system and better ergonomics than the YS-50. So I'm not too upset about it being discontinued. The 1.8/3.5 mounts are not that well thought out. They have a very small footprint and you can't fit the 1.8/3.5 lens mount perfectly flush without bending it. There is no room at all at the back of the body for a small
