Uremic cardiomyopathy has been considered a benign disease characterized by diastolic dysfunction, although several evidences showed that it is a heart disease with an independent prognosis. It has been therefore associated with an increased mortality rate with a 4-fold increased risk of heart failure in comparison with non-uremic patients. Nevertheless, the optimal care for these patients is still controversial and given the lack of effective and safe therapeutic strategy, a revision of our approach is warranted. Areas covered: A literature search in PubMed has been performed. The review evaluates the controversies surrounding the definition, diagnosis and the therapies of uremic cardiomyopathy. The most recent guidelines for dialysis treatment are reviewed for a potential role in the management of these patients. Expert opinion: The debate on the definition of uremic cardiomyopathy remains unresolved and new trials are needed. There are evidences that identify heart failure secondary to dialysis as a CV complication that is the leading cause of death in patients on dialysis. Thus, improving kidney transplant outcomes and dialysis options for patients who are not candidates for transplantation are important objectives. Both dialysis patients and kidney transplant patients have benefited from progress in the ability to prevent kidney damage with better dialysis schemes and a careful screening of kidney donors and recipients, respectively. However, both require a better follow-up by an efficient health care system in order to avoid prognosis and mortality. 6d1f23a050
