the keyboard is located. AMD is likely bringing its EPYC Rome chips to servers AMD will launch a new version of its EPYC chips that is built for servers, the chip maker confirmed. "We are working with IBM to identify where there might be overlap in the R&D," AMD's CEO Lisa Su told AFP in an interview. She declined to provide further details, but did not rule out that AMD could release EPYC for servers before EPYC for servers. "It is likely the two will arrive together," she said. AMD is in a bit of a tricky spot. Server demand is low this year, but the company is counting on a rebound in 2017. It is also facing a deep cut in sales as it tussles with a slowdown in PCs. "We believe 2017 will be a great year for AMD," Su said in a statement. "We expect to see revenue growth in 2017 driven by new product introductions and increased sales of our most powerful and energy efficient CPU, EPYC." AMD's top rival Intel has been launching servers and servers-on-chips for more than a decade, and has a substantial lead in the server market. Last year, Intel launched the Xeon W line as a low-power alternative to traditional servers. The new Xeon Scalable line is available today and supports up to 12 CPUs, half-height servers, and HPC workloads. The Ryzen chips follow a year of Ryzen PCs and Ryzen-based desktops, which have been well received and have helped AMD's desktop business. AMD also sells its EPYC line in servers, but has been more focused on the low-power embedded and automotive market. This year, AMD is expecting a launch of EPYC in the server market, before EPYC servers are released in 2018. Su also said that her company is invested in x86 emulation for software, while insisting

---

that it does not mean that it is more interested in x86 emulation than ARM. "Not at all. Not at all. What we are talking about is what we call hybrid computing -- using both ARM and x86 in parallel in a single system," Su 6d1f23a050
